

Geological surveys

The applications in this field are different from the analyse before buying or selling the fields in the difficult areas, until the exploration of the rocks (ballast-holes, mineral deposit, coals, etc.).

Geological mapping for exploration

- Geological mapping
- Mapping mining works
- Geological studies for mineral substances
- Project plans, strategies for development of the projects
- Data processing, statical analysis, drawing maps, interpretation
- Mapping drillings, physical and chemical analysis, analyze the data
- Geological-technical studies for laying out the research works/mining, example: water drillings, geological drillings, quarries etc.

Types of documentation with geological character and geological-technical character

- Ambient geology
- Study of feasibility
- Geological documentation
- Evaluation and monitoring studies
- Geological reports in stage and final of the estimate reserves
